

Benefits

- no passwords needed
- encryption is unique to each file
- owner key can change permissions, server checks latest approved public keys
- Recipient verifies using their preferred method.
- No central access control (server isn't verifying identity via auto selecting IdP, it just hosts encrypted info and public keys)
- Server can be compromised/public, it doesn't have the ability to decrypt document since the private keys live at the client level and are not accessible to the server
